NEW DELHI 110002

December 2003

Price Group 3
FOREWORD

This Indian Standard (Fourth Revision) was adopted by the Bureau of Indian Standards, after the draft finalized by the Jute and Jute Products Sectional Committee had been approved by the Textile Division Council.

This standard was first published in 1950 and revised in 1969, 1975 and 1987. The original standard covered WHITE (Corchorus Capsularis) and TOSSA (Corchorus Olitorius) jute and classified them into 4 grades, namely, tops, middles, bottoms and cross(X). The first revision of the standard included DAISEE (Corchorus Olitorius) jute in addition to WHITE and TOSSA. The WHITE jute was classified into 8 grades, namely, W1, W2, W3, W4, W5, W6, W7 and W8; and TOSSA and DAISEE jute into 8 grades, namely, TD1, TD2, TD3, TD4, TD5, TD6, TD7 and TD8. A scoring system was also introduced to grade the fibres on the basis of the different characteristics. In the second revision, the scores for different characteristics were modified to facilitate effective implementation of the standard. In the third revision, 'Defects' parameter in respect of grades W2 to W5 for WHITE jute and TD2 to TD5 for TOSSA and DAISEE were modified. The present revision of this standard has been taken up to incorporate the modified scores for different characteristics and maximum root content for better implementation by the jute growers and traders.

The composition of the Committee responsible for the formulation of this standard is given in Annex B.

For the purpose of deciding whether a particular requirement of this standard is complied with the final value, observed or calculated, expressing the result of a test or analysis, shall be rounded off in accordance with IS 2:1960 'Rules for rounding off numerical values (revised)'. The number of significant places retained in the rounded off value should be the same as that of the specified value in this standard.
Indian Standard

TEXTILES — GRADING OF WHITE, TOSSA AND DALSEE UNCUT INDIAN JUTE

( Fourth Revision )

1 SCOPE

This standard covers the grading of WHITE, TOSSA and DALSEE jute from which the roots have not been cut.

2 REFERENCES

The standards listed in Annex A contain provisions which through reference in this text, constitute provisions of this standard. At the time of publication, the editions indicated were valid. All standards are subject to revision and parties to agreements based on this standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated in Annex A.

3 TERMINOLOGY

3.0 For the purpose of this standard, the following definitions along with definitions given in IS 5476 shall apply.

3.1 Jute — A multicellular fibre obtained from the bast of various species of Corchorus, of which the round pod jute (Corchorus Capsularis or WHITE jute) and the long pod jute (Corchorus Olltiorius or TOSSA or DALSEE jute) are the most important. The fibre strands are long usually varying from 1.5 to 3.5 m.

3.2 Parcel — A consignment containing certain number of bales, bundles or drums.

3.3 Strength — The ability of the fibre to resist strain or rupture induced by external forces.

3.4 Colour — The property of a fibre which distinguishes its appearance as redness, yellowness, greyness, etc.

3.4.1 The colour description of WHITE, TOSSA and DAISEE jute in relation to the terms used for the purpose of grading is given below:

<table>
<thead>
<tr>
<th>Term</th>
<th>Colour Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WHITE Jute</td>
<td>TOSSA Jute</td>
</tr>
<tr>
<td>Good</td>
<td>Creamy pink to brownish white</td>
</tr>
<tr>
<td>Fairly good</td>
<td>Brownish to reddish white with some light grey</td>
</tr>
<tr>
<td>Fair average</td>
<td>Brownish to light grey</td>
</tr>
<tr>
<td>Average</td>
<td>Grey to dark</td>
</tr>
</tbody>
</table>

3.5 Lustre — It depends on the display of light reflected from the fibre exposed to normal light. Higher lustre in jute is generally a characteristic of a better quality fibre.

3.6 Density — Mass per unit volume of the fibre including its air-spaces. The higher density (heavy body) is a characteristic of better quality of fibre.

3.7 Fineness — A measure of diameter (width) or mass per unit length, or both, of the fibre filament. The finer the fibre, the better the spinning quality.

3.8 Reed — The fibre system from one individual jute plant.

3.9 Reed Length — The entire length of the reed including the root and tip.

3.10 Effective Reed Length — The length of the reed after the root and crop ends have been removed.

3.11 Root — The hard barky region at the lower end of the reed normally called cuttings.

3.12 Defects

3.12.1 Major
Centre root, dazed and over-retted fibre, runners, knots, mossy fibres and entangled sticks.

3.12.2 Minor
Weak croppy end, gummy fibre, loose leaf, loose sticks and specks.

3.13 Centre Root (BUKCHHAL) — The hard barky region in the middle part of the reed which requires additional softening treatment.
3.14 **Dazed Fibre** — Fibre which is weak in strength and dull in appearance, due to usually being stored in moist condition.

3.15 **Over Retted Fibre** — Fibre which has lost its strength and lustre on decomposing due to long retting.

3.16 **Runners** — Hard barking fibre running from the lower end to the middle region, more or less continuously.

3.17 **Knots** — Stiff barking spots in the body of the strand which break the continuity of fibre when opened.

3.18 **Mossy Fibre** — It is a type of vegetation which sometimes gets attached to the jute plant during flood conditions; some portions may remain on the jute fibre even after retting and washing. It can be separated by hand.

3.19 **Sticks, Entangled Sticks and Loose Sticks** — Sticks are remnants of woody part of jute plant over which fibre sheath is formed. Entangled sticks are broken sticks which are linked with fibre mass and are not easily removable. Loose sticks are broken sticks easily removable by shaking.

3.20 **Croppy Fibre** — Fibre with top ends rough and hard (but not barking) caused by careless retting.

3.21 **Weak Croppy Fibre** — Fibre over a length of about 30 cm at the top and which has become unusually weak.

3.22 **Gummy Fibres** — Fibres held together by undissolved pectinous matter.

3.23 **Leaf, Loose Leaf** — Dark grey leafy or paper like substance (remnants of loosened skin of the plant) appearing on the strand. Loose leaves are those that lie loosely on the fibre and are easily removable.

3.24 **Specks** — Soft barking spots in the body where fibres can be separated with some effort without breaking their continuity, though they may remain as weak spots.

3.25 **Hunka** — The very hard barking fibre running continuously from the lower end to almost the tip of the reed.

3.26 **Natural Dust** — The dust which might get associated with the fibre during the process of its production.

4 **UNIT OF GUARANTEE**

The unit of guarantee shall be a bale, bundle or drum made up of 'MORAHS' or 'heads'. For purposes of appraisement, each such bale, bundle, or drum shall be treated as a separate unit and shall, in itself, fulfil the guarantee of the grade.

5 **GRADING**

5.1 All **WHITE** raw jute (from which the roots have not been cut) shall be classified into following 8 grades:

W1, W2, W3, W4, W5, W6, W7 and W8

5.2 All **TOSSA** and **DASEE** raw jute (from which the roots have not been cut) shall be classified into the following 8 grades:

TD1, TD2, TD3, TD4, TD5, TD6, TD7 and TD8.

5.3 The following quality characteristics, which have a bearing on the quality, have been taken into account in assessing the grade of jute fibres:

(a) strength, (b) defects, (c) root content, (d) colour, (e) fineness, and (f) density.

5.4 The hand and eye method may be used for the present in assessing these qualities until such time as suitable instrumental methods are available for scientific assessment of certain important characteristics.

NOTE — For comparing strength, tufts of fibre of approximately equal size may be held equal distance apart and broken longitudinally without jerk. Good lustre also indicates good fibre strength. Root content in terms of percentage by mass may be judged by observing the extent of barks along the length. Density of heavy bodiedness of fibre may be assessed by feeling the heaviness of a bunch of fibre reeds (by raising and lowering) when held within a grip.

5.5 The requirements of each individual quality characteristic in the case of each of the 8 grades for **WHITE** jute are given in Table 1, and for **TOSSA** and **DASEE** jute in Table 2.

5.6 Relative weightage to each of the quality characteristics has been attributed by a system of scoring scheme to the various grades. The allocation of scores for the different quality characteristics as in each grade for **WHITE** jute shall be done on the basis of Table 1. For **TOSSA** and **DASEE** jute it shall be done on the basis of Table 2.

6 **PACKING**

6.1 The jute shall be so packed that **MORAHS** in any one bale, bundle or drum are of only one grade.

6.2 Each bale, bundle or drum shall have a grade-tag indicating the year of harvest, variety, grade and trade-mark.
Table 1 Requirements of Fibre Characteristics and Scoring Scheme for Different Grades of WHITE Jute (*Corchorus Capsularis*) *(Clauses 5.5 and 5.6)* *(Figures in parenthesis indicate score marks)*

NOTES
1. The minimum reed length should be 150 cm, or the effective reed length should not be less than 100 cm except for W8.
2. Jute should be in dry storable condition.
3. Jute should be free from HUNKA, mud and other foreign materials.
4. Natural dust may be allowed in grades W3 to W8 with proportionate discount.
5. Root content will include hard barking cropply ends.
6. A parcel of jute which would not secure full marks for a particular grade shall still be considered for that grade with suitable discount to be settled between the buyer and the seller, provided its score is not less, by 50 (or more) percent of the difference, between the maximum scores for that and the next lower grade. When the score is less by 50 (or more) percent of the difference, the buyer will have option to reject or settle with a suitable discount.
7. Scores on the table may be taken as guidance for determining the discount.

**NOTES**
1. The minimum reed length should be 150 cm, or the effective reed length should not be less than 100 cm except for TD8.
2. Jute should be in dry storable condition.
3. Jute should be free from HUNKA, mud and other foreign materials.
4. Natural dust may be allowed in grades TD3 to TD8 with proportionate discount.
5. Root content will include hard barked croppy ends.
6. A parcel of jute which would not secure full marks for a particular grade shall still be considered for that grade with suitable discount to be settled between the buyer and the seller, provided its score is not less, by 50 (or more) percent of the difference, between the maximum scores for that and the next lower grade. When the score is less by 50 (or more) percent of the difference, the buyer will have option to reject or settle with a suitable discount.
7. Scores on the table may be taken as guidance for determining the discount.
8. For instrumental determination of various characteristics like strength, defects, root content, fineness, bulk density, etc, reference to the relevant part of IS 7032.

Bureau of Indian Standards

BIS is a statutory institution established under the Bureau of Indian Standards Act, 1986 to promote harmonious development of the activities of standardization, marking and quality certification of goods and attending to connected matters in the country.

Copyright

BIS has the copyright of all its publications. No part of these publications may be reproduced in any form without the prior permission in writing of BIS. This does not preclude the free use, in the course of implementing the standard, of necessary details, such as symbols and sizes, type or grade designations. Enquiries relating to copyright be addressed to the Director (Publications), BIS.

Review of Indian Standards

Amendments are issued to standards as the need arises on the basis of comments. Standards are also reviewed periodically; a standard along with amendments is reaffirmed when such review indicates that no changes are needed; if the review indicates that changes are needed, it is taken up for revision. Users of Indian Standards should ascertain that they are in possession of the latest amendments or edition by referring to the latest issue of ‘BIS Catalogue’ and ‘Standards: Monthly Additions’.

This Indian Standard has been developed from Doc : No. TX 03 (0662).
